Acknowledgments

We are grateful for the participants for volunteering their time and personal data. Many thanks are owed to research personnel who collected and processed these data. The work was supported by NIH/NIA Grant P30 AG072946, MSU's RCPC, and MSU's Office of Research and Graduate Programs.

Eudaimonic Activity Model (EAM)

Eudaimonic motives and activities lead to psychological need satisfaction, which, in turn, leads to SWB (Martela & Sheldon, 2019)

Summary

- For all analyses, we controlled for age, sex, education, MCI or Nonclinical, and having ≥ 1 Apoe4 or not.
- The GDS is significantly associated with subjective well-being, psychological well-being (i.e., need satisfaction), and SF-36. All measures were modestly associated with the SF-36 ($.209 < |r| < .642$)
- Compared to the involved participants, single participants reported higher ratings on SPANE positive ($p = .007$) and lower ratings on SPANE negative ($p = .043$).
- The effect of relationship status was not significant for SWLS ($p = .336$) and PWBS ($p = .075$).
- Need Satisfaction partially mediates the relationship between psychological flexibility and SWB.

Implications

- These findings suggest clinicians may consider techniques that increase psychological need satisfaction to foster increased subjective well-being, which leads to positive health outcomes

Limitations

- Only self-report data (Risk of social desirability and Lack of objectivity)
- Using an online only sample
- Mostly white, well-educated middle-class sample; few single males
- No causation can be inferred

Future Directions

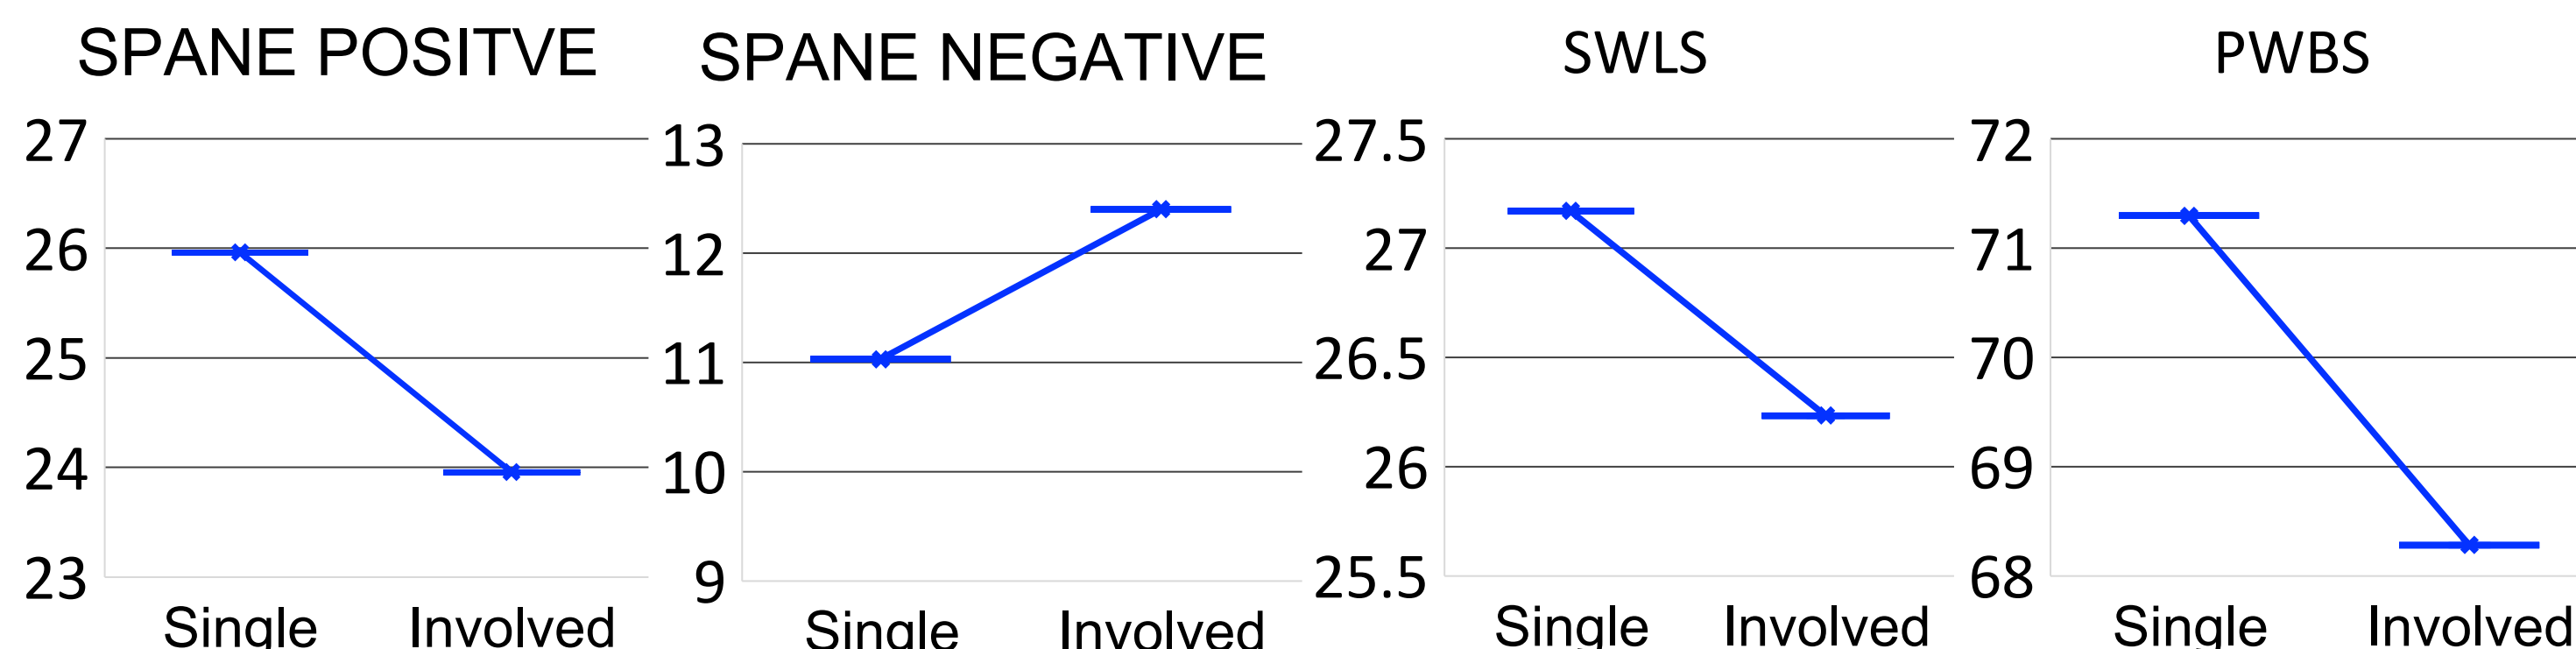

- Future studies may compare findings regarding the Eudaimonic Activity Model with a sample of young to middle-aged adults
- Examine activities or strategies that increase psychological well-being/need satisfaction, for instance, activities that increase psychological flexibility

Partial Correlations

	GDS-15	SPANE Positive	SPANE Negative	SWLS	PWBS
GDS-15					
Role Limit Phys.Prob.	-.546	.359	-.266	.291	.369

All p 's $< .05$ unless otherwise noted *nonsignificant

Effect of Relationship Status

Mediating Role of Need Satisfaction

- The three subscales of the PWBS (i.e., Autonomy, Environmental Mastery, and Positive Relations with Others) were combined to form a Need Satisfaction score
- Hayes's (2022) PROCESS macro was used to explore the EAM

Mediator	Total Effect	Direct Effect	Indirect effect	95% CI	
				Lower	Upper
Life Satisfaction (Y ₁)					
Need Satisfaction	.3132**	.1060*	.2071	.1241	.2993
Positive Affect (Y ₂)					
Need Satisfaction	.2864**	.1305**	.1559	.0984	.2201
Negative Affect (Y ₃)					
Need Satisfaction	-.2078**	-.0758*	-.1319	-.1863	-.0826

** $p < .001$ * $p < .05$

Population

- 190 Nondemented older adults enrolled in SBCOA longitudinal study
- 66 males, 124 females
- 9.1% single males, 46.7% single females

Data Collection

- Emails sent in August 2023 asking to contribute well-being data via secure online survey

Materials

- Scale of Positive and Negative Experiences (SPANE)
- Psychological Wellbeing Scale (PWBS)
- Satisfaction With Life Scale (SWLS)
- Multidimensional Psychological Flexibility Inventory (MPFI)
